Overview

The dashboard was created as an analytics extension to the literature review, *"The influence of empathy in legal professionals handling violent cases involving ASPD offenders on susceptibility to secondary traumatic stress",* helping evaluate the review with reduced subject bias via descriptive visual analysis. Structure dataset was created from the included studies and descriptive analysis was conducted using Power BI. This dashboard allows users to explore characteristics of the reviewed studies interactively.

Dashboard Components

1. **KPI Cards**

Total Studies: presents the sum of all studies
Countries Represented: presents the number of countries the studies were from
Mean Sample Size: calculates and presents the total sample size divided by the total number of studies.
Median Sample Size: calculates and presents the middle most sample size when arranged in ascending order.

2. **Visuals**

Population Distribution: This shows the number of studies for each population studied
Country Distribution: This shows the number of studies based from each country
Study Category Distribution: This shows the number of studies for each study category
Exposure Population by Median Sample Size: This shows the median sample size for each exposure population (the group of people that the sample was exposed to i.e lawyers who interacted with traumatic victims, where traumatic victims is the exposure group) studied.

Filters purpose

Country: to explore included studies' characteristics geographically
Population: to analyse the included studies specifically based on the population studied.
Exposure Population: to analyse population each included studies' sample was exposed to
Study Category: to compare included studies categorically to its study type

Usage Guide

Steps to follow:

1. Open dashboard.
2. Select filter.
3. Visuals update.
4. Multiple filters can be applied simultaneously
5. Clear filters to restore full dataset view
